Document 1: JP 2001-240411 A (NGK Insulators, Ltd., et al.), 04 September 2001

Document 2: JP 2003-144871 A (Tosoh Corp.), 20 May 2003

The invention set forth in claims 18 and 19 lacks novelty in the light of document 1 cited in the international search report.

Document 1 discloses a tubular zeolite separation membrane wherein the zeolite single crystals have a crystal growth axis that is perpendicular to the surface of the tubular porous support member (refer to claims 1 to 3, paragraphs [0002] and [0010], and the examples).

The inventions set forth in claims 1, 4, 5, 7 to 11, 13 to 16, 20 and 24 do not involve an inventive step in the light of documents 1 and 2 cited in the international search report.

Document 1 does not disclose a feature wherein both the upper end and the lower end of the tubular porous support member that is disposed within the reaction solution are open. However, in the prior art it is common practice to form a zeolite membrane by fluidizing the reaction solution and then bringing the reaction solution into contact with the entire surface of the support

member in a uniform manner in order to obtain a uniform membrane, as disclosed in document 2 (refer to paragraph [0022]). As a result, it would have been easy for a person skilled in the art to conceive of configuring the inventions that are set forth in claims 1, 4, 5, 7 to 11, 13 to 16, 20 and 24 by employing such a well-known configuration in the invention that is disclosed in document 1.

Furthermore, the specific manner in which the fluidization of the reaction solution is achieved, the specific manner in which the reaction solution is heated, the specific dimensions for the structure of the equipment and the specific thickness of the grain boundary layer are all features that could have been configured in an appropriate manner by a person skilled in the art, as desired.
